The following SPC Benchmark™ Remote Audit requirements were reviewed and found compliant with 1.14 of the SPC Benchmark™ specification:

- A Letter of Good Faith, signed by a senior executive.
- The following Data Repository storage items were verified by information supplied by Fujitsu Limited:
  - Physical Storage Capacity and requirements.
  - Configured Storage Capacity and requirements.
  - Addressable Storage Capacity and requirements.
  - Capacity of each Logical Volume and requirements.
  - Capacity of each Application Storage Unit (ASU) and requirements.
- The total Application Storage Unit (ASU) Capacity was filled with random data, using an auditor approved tool, prior to execution of the SPC-1 Tests.

AUDIT CERTIFICATION (CONT.)

Fujitsu Storage Systems ETERNUS DX100 S3
SPC-1 Audit Certification

- An appropriate diagram of the Benchmark Configuration (BC)/Tested Storage Configuration (TSC).
- Listings and commands to configure the Benchmark Configuration/Tested Storage Configuration, including customer tunable parameters that were changed from default values.
- SPC-1 Workload Generator commands and parameters used for the audited SPC Test Runs.
- The following Host System requirements were verified by information supplied by Fujitsu Limited:
  ✓ The type of Host Systems including the number of processors and main memory.
  ✓ The presence and version number of the SPC-1 Workload Generator on each Host System.
  ✓ The TSC boundary within each Host System.
- The execution of each Test, Test Phase, and Test Run was found compliant with all of the requirements and constraints of Clauses 4, 5, and 11 of the SPC-1 Benchmark Specification.
- The Test Results Files and resultant Summary Results Files received from Fujitsu Limited for each of following were authentic, accurate, and compliant with all of the requirements and constraints of Clauses 4 and 5 of the SPC-1 Benchmark Specification:
  ✓ Data Persistence Test
  ✓ Sustainability Test Phase
  ✓ IOPS Test Phase
  ✓ Response Time Ramp Test Phase
  ✓ Repeatability Test
- There were no differences between the Tested Storage Configuration (TSC) and the Priced Storage Configuration.
- The submitted pricing information met all of the requirements and constraints of Clause 8 of the SPC-1 Benchmark Specification.
- The Full Disclosure Report (FDR) met all of the requirements in Clause 9 of the SPC-1 Benchmark Specification.
- This successfully audited SPC measurement is not subject to an SPC Confidential Review.

Audit Notes:
There were no audit notes or exceptions.

Respectfully,

Walter E. Baker
SPC Auditor

Subject: SPC-1 Letter of Good Faith for the FUJITSU Storage ETERNUS DX100 S3

Fujitsu Limited is the SPC-1 Test Sponsor for the above listed product. To the best of our knowledge and belief, the required SPC-1 benchmark results and materials we have submitted for that product are complete, accurate, and in full compliance with V2.3.0 of the SPC-1 benchmark specification.

In addition, we have reported any items in the Benchmark Configuration and execution of the benchmark necessary to reproduce the reported results even if the items are not explicitly required to be disclosed by the SPC-1 benchmark specification.

Signed: 

Date:

Shigeo Konno
General Manager, Storage System Division

Tested Storage Product (TSP) Description
The scalable and unified Fujitsu Storage ETERNUS DX100 S3 delivers enterprise-class functionality to small and medium-sized companies and subsidiaries with an excellent price/performance ratio. It is the perfect solution when consolidating data for server virtualization, e-mail, databases and business applications as well a centralized file services. Simple, intuitive system management, highly flexible network connectivity and the option of field upgrades to higher system classes significantly reduce operational and migration costs. The ETERNUS DX family architecture lets customers benefit from software options, such as thin provisioning, automatic storage tiering and quality of service management even as early as the entry-level class. This all contributes to better business support.

</tbody>
</table>

SPC-1 IOPS™ represents the maximum I/O Request Throughput at the 100% load point.

SPC-1 Price-Performance™ is the ratio of Total Price to SPC-1 IOPS™.

Total ASU (Application Storage Unit) Capacity represents the total storage capacity available to be read and written in the course of executing the SPC-1 benchmark.

A Data Protection Level of Protected 2 using Mirroring configures two or more identical copies of user data.

Protected 2: The single point of failure of any component in the configuration will not result in permanent loss of access to or integrity of the SPC-1 Data Repository.

Total Price includes the cost of the Priced Storage Configuration plus three years of hardware maintenance and software support as detailed on page 17.

Currency Used is formal name for the currency used in calculating the Total Price and SPC-1 Price-Performance™. That currency may be the local currency of the Target Country or the currency of a difference country (non-local currency).

The Target Country is the country in which the Priced Storage Configuration is available for sale and in which the required hardware maintenance and software support is provided either directly from the Test Sponsor or indirectly via a third-party supplier.
Storage Capacities, Relationships, and Utilization

The following four charts and table document the various storage capacities, used in this benchmark, and their relationships, as well as the storage utilization values required to be reported.
Configured Storage Capacity: 3,141.769 GB

Addressable Storage Capacity: 1,202.591 GB
- ASU-1 Capacity: 504.000 GB (41.91%)
  - 2 Logical Volumes, 252.000 GB per Volume
- ASU-2 Capacity: 504.000 GB (41.91%)
  - 2 Logical Volumes, 252.000 GB per Volume
- ASU-3 Capacity: 112.000 GB (9.31%)
  - 2 Logical Volumes, 56.000 GB per Volume

Unused Addressable Capacity: 82.591 GB (6.87%)

Configured Storage Capacity Available for Application Use:
3,141.769 GB
100.00%

Data Protection Capacity (used):
1,120.000 GB
35.65%

Unused Data Capacity:
368.293 GB
11.72%

Data Protection Capacity (unused):
450.884 GB
14.35%
**Application Utilization:** Total ASU Capacity (1,120,000 GB) divided by Physical Storage Capacity (3,200,000 GB).

**Protected Application Utilization:** (Total ASU Capacity (1,120,000 GB) plus total Data Protection Capacity (1,570,884 GB) minus unused Data Protection Capacity 450.884 GB)) divided by Physical Storage Capacity (3,200,000 GB).

**Unused Storage Ratio:** Total Unused Capacity (910.359 GB) divided by Physical Storage Capacity (3,200,000 GB) and may not exceed 45%.

Detailed information for the various storage capacities and utilizations is available on pages 23-24.
Response Time – Throughput Curve

The Response Time-Throughput Curve illustrates the Average Response Time (milliseconds) and I/O Request Throughput at 100%, 95%, 90%, 80%, 50%, and 10% of the workload level used to generate the SPC-1 IOPS™ metric.

The Average Response Time measured at any of the above load points cannot exceed 30 milliseconds or the benchmark measurement is invalid.

SFPs are included.

Total: $54,892.68

The above pricing includes hardware maintenance and software support for three years, 7 days per week, 24 hours per day. The hardware maintenance and software support provides the following:

- Acknowledgement of new and existing problems within four (4) hours.
- Onsite presence of a qualified maintenance engineer or provision of a customer replaceable part within four (4) hours of the above acknowledgement for any hardware failure that results in an inoperative Price Storage Configuration that can be remedied by the repair or replacement of a Priced Storage Configuration component.

Differences between the Tested Storage Configuration (TSC) and Priced Storage Configuration

There were no differences between the TSC and Priced Storage Configuration.

      (4 ports per CM, 8 ports total,
       3 ports used per CM, 6 ports total used)
  1 – SAS Expander Drive Interface with QSFP 12 Gbps SAS-3
    (1 – SAS-3 x4 link per interface,
     1 – SAS-3 x4 link used)

8 – 400 GB SAS MLC 2.5" SSD storage devices
In each of the following sections of this document, the appropriate Full Disclosure Report requirement, from the SPC-1 benchmark specification, is stated in italics followed by the information to fulfill the stated requirement.

**CONFIGURATION INFORMATION**

**Benchmark Configuration (BC)/Tested Storage Configuration (TSC) Diagram**

*Clause 9.4.3.4.1*

A one page Benchmark Configuration (BC)/Tested Storage Configuration (TSC) diagram shall be included in the FDR...

The Benchmark Configuration (BC)/Tested Storage Configuration (TSC) is illustrated on page 20 (*Benchmark Configuration/Tested Storage Configuration Diagram*).

**Storage Network Configuration**

*Clause 9.4.3.4.1*

...  

5. If the TSC contains network storage, the diagram will include the network configuration. If a single diagram is not sufficient to illustrate both the Benchmark Configuration and network configuration in sufficient detail, the Benchmark Configuration diagram will include a high-level network illustration as shown in Figure 9-8. In that case, a separate, detailed network configuration diagram will also be included as described in Clause 9.4.3.4.2.

*Clause 9.4.3.4.2*

If a storage network was configured as a part of the Tested Storage Configuration and the Benchmark Configuration diagram described in Clause 9.4.3.4.1 contains a high-level illustration of the network configuration, the Executive Summary will contain a one page topology diagram of the storage network as illustrated in Figure 9-9.

The Benchmark Configuration (BC)/Tested Storage Configuration (TSC) utilized direct attached storage.

**Host System(s) and Tested Storage Configuration (TSC) Table of Components**

*Clause 9.4.3.4.3*

The FDR will contain a table that lists the major components of each Host System and the Tested Storage Configuration (TSC).

The Host System(s) and TSC table of components may be found on page 20 (*Host System and Tested Storage Configuration Components*).

Customer Tunable Parameters and Options

Clause 9.4.3.5.1

All Benchmark Configuration (BC) components with customer tunable parameter and options that have been altered from their default values must be listed in the FDR. The FDR entry for each of those components must include both the name of the component and the altered value of the parameter or option. If the parameter name is not self-explanatory to a knowledgeable practitioner, a brief description of the parameter’s use must also be included in the FDR entry.

Appendix B: Customer Tunable Parameters and Options on page 64 contains the customer tunable parameters and options that have been altered from their default values for this benchmark.

Tested Storage Configuration (TSC) Description

Clause 9.4.3.5.2

The FDR must include sufficient information to recreate the logical representation of the TSC. In addition to customer tunable parameters and options (Clause 4.2.4.5.3), that information must include, at a minimum:

- A diagram and/or description of the following:
  - All physical components that comprise the TSC. Those components are also illustrated in the BC Configuration Diagram in Clause 9.2.4.4.1 and/or the Storage Network Configuration Diagram in Clause 9.2.4.4.2.
  - The logical representation of the TSC, configured from the above components that will be presented to the Workload Generator.
- Listings of scripts used to create the logical representation of the TSC.
- If scripts were not used, a description of the process used with sufficient detail to recreate the logical representation of the TSC.

Appendix C: Tested Storage Configuration (TSC) Creation on page 65 contains the detailed information that describes how to create and configure the logical TSC.

SPC-1 Workload Generator Storage Configuration

Clause 9.4.3.5.3

The FDR must include all SPC-1 Workload Generator storage configuration commands and parameters.

The SPC-1 Workload Generator storage configuration commands and parameters for this measurement appear in Appendix D: SPC-1 Workload Generator Storage Commands and Parameters on page 69.
ASU Pre-Fill

Clause 5.3.3

Each of the three SPC-1 ASUs (ASU-1, ASU-2 and ASU-3) is required to be completely filled with specified content prior to the execution of audited SPC-1 Tests. The content is required to consist of random data pattern such as that produced by an SPC recommended tool.

The configuration file used to complete the required ASU pre-fill appears in Appendix D: SPC-1 Workload Generator Storage Commands and Parameters on page 69.
SPC-1 DATA REPOSITORY

This portion of the Full Disclosure Report presents the detailed information that fully documents the various SPC-1 storage capacities and mappings used in the Tested Storage Configuration. SPC-1 Data Repository Definitions on page 60 contains definitions of terms specific to the SPC-1 Data Repository.

Storage Capacities and Relationships

Clause 9.4.3.6.1

Two tables and four charts documenting the storage capacities and relationships of the SPC-1 Storage Hierarchy (Clause 2.1) shall be included in the FDR. ... The capacity value in each chart may be listed as an integer value, for readability, rather than the decimal value listed in the table below.

SPC-1 Storage Capacities

The Physical Storage Capacity consisted of 3,200.000 GB distributed over 12 solid state devices (SSDs) each with a formatted capacity of 400.000 GB. There was 8.590 GB (0.27%) of Unused Storage within the Physical Storage Capacity. Global Storage Overhead consisted of 49.642 GB (1.55%) of the Physical Storage Capacity. There was 736.587 GB (23.44%) of Unused Storage within the Configured Storage Capacity. The Total ASU Capacity utilized 93.13% of the Addressable Storage Capacity resulting in 82.591 GB (6.92%) of Unused Storage within the Addressable Storage Capacity. The Data Protection (Mirroring) capacity was 1,570.884 GB of which 1,120.000 GB was utilized. The total Unused Storage capacity was 910.359 GB.

Note: The configured Storage Devices may include additional storage capacity reserved for system overhead, which is not accessible for application use. That storage capacity may not be included in the value presented for Physical Storage Capacity.

SPC-1 Storage Capacity Charts

Physical Storage Capacity: 3,200.000 GB

- Unused Physical Capacity: 8.590 GB 0.27%
- Configured Storage Capacity: 3,141.769 GB 98.18%
- Global Storage Overhead: 49.642 GB 1.55%
- Total RAID Group Capacity: 1,570.884 GB 49.09%
- Data Protection Capacity: 1,570.884 GB 49.09%
Storage Capacity Utilization

Clause 9.4.3.6.2
The FDR will include a table illustrating the storage capacity utilization values defined for Application Utilization (Clause 2.8.1), Protected Application Utilization (Clause 2.8.2), and Unused Storage Ratio (Clause 2.8.3).

Clause 2.8.1
Application Utilization is defined as Total ASU Capacity divided by Physical Storage Capacity.

Clause 2.8.2
Protected Application Utilization is defined as (Total ASU Capacity plus total Data Protection Capacity minus unused Data Protection Capacity) divided by Physical Storage Capacity.

Clause 2.8.3
Unused Storage Ratio is defined as Total Unused Capacity divided by Physical Storage Capacity and may not exceed 45%.

<table>

</table>
Logical Volume Capacity and ASU Mapping

Clause 9.4.3.6.3

A table illustrating the capacity of each ASU and the mapping of Logical Volumes to ASUs shall be provided in the FDR. ... Logical Volumes shall be sequenced in the table from top to bottom per its position in the contiguous address space of each ASU. The capacity of each Logical Volume shall be stated. ... In conjunction with this table, the Test Sponsor shall provide a complete description of the type of data protection (see Clause 2.4.5) used on each Logical Volume.

<table>
<thead>

</tr>
</tbody>
</table>

The Data Protection Level used for all Logical Volumes was Protected 2 using Mirroring as described on page 12. See “ASU Configuration” in the IOPS Test Results File for more detailed configuration information.
SPC-1 BENCHMARK EXECUTION RESULTS

This portion of the Full Disclosure Report documents the results of the various SPC-1 Tests, Test Phases, and Test Runs. An SPC-1 glossary on page 60 contains definitions of terms specific to the SPC-1 Tests, Test Phases, and Test Runs.

Clause 5.4.3

The Tests must be executed in the following sequence: Primary Metrics, Repeatability, and Data Persistence. That required sequence must be uninterrupted from the start of Primary Metrics to the completion of Persistence Test Run 1. Uninterrupted means the Benchmark Configuration shall not be power cycled, restarted, disturbed, altered, or adjusted during the above measurement sequence. If the required sequence is interrupted other than for the Host System/TSC power cycle between the two Persistence Test Runs, the measurement is invalid.

SPC-1 Tests, Test Phases, and Test Runs

The SPC-1 benchmark consists of the following Tests, Test Phases, and Test Runs:

- **Primary Metrics Test**
  - Sustainability Test Phase and Test Run
  - IOPS Test Phase and Test Run
  - Response Time Ramp Test Phase
    - 95% of IOPS Test Run
    - 90% of IOPS Test Run
    - 80% of IOPS Test Run
    - 50% of IOPS Test Run
    - 10% of IOPS Test Run (LRT)

- **Repeatability Test**
  - Repeatability Test Phase 1
    - 10% of IOPS Test Run (LRT)
    - IOPS Test Run
  - Repeatability Test Phase 2
    - 10% of IOPS Test Run (LRT)
    - IOPS Test Run

- **Data Persistence Test**
  - Data Persistence Test Run 1
  - Data Persistence Test Run 2

Each Test is an atomic unit that must be executed from start to finish before any other Test, Test Phase, or Test Run may be executed.

The results from each Test, Test Phase, and Test Run are listed below along with a more detailed explanation of each component.
“Ramp-Up” Test Runs

Clause 5.3.13
In order to warm-up caches or perform the initial ASU data migration in a multi-tier configuration, a Test Sponsor may perform a series of “Ramp-Up” Test Runs as a substitute for an initial, gradual Ramp-Up.

Clause 5.3.13.3
The “Ramp-Up” Test Runs will immediately precede the Primary Metrics Test as part of the uninterrupted SPC-1 measurement sequence.

Clause 9.4.3.7.1
If a series of “Ramp-Up” Test Runs were included in the SPC-1 measurement sequence, the FDR shall report the duration (ramp-up and measurement interval), BSU level, SPC-1 IOPS and average response time for each “Ramp-Up” Test Run in an appropriate table.

There were no “Ramp-Up” Test Runs executed.

Primary Metrics Test – Sustainability Test Phase

Clause 5.4.4.1.1
The Sustainability Test Phase has exactly one Test Run and shall demonstrate the maximum sustainable I/O Request Throughput within at least a continuous eight (8) hour Measurement Interval. This Test Phase also serves to insure that the TSC has reached Steady State prior to reporting the final maximum I/O Request Throughput result (SPC-1 IOPSTM). 

Clause 5.4.4.1.2
The computed I/O Request Throughput of the Sustainability Test must be within 5% of the reported SPC-1 IOPSTM result.

Clause 5.4.4.1.4
The Average Response Time, as defined in Clause 5.1.1, will be computed and reported for the Sustainability Test Run and cannot exceed 30 milliseconds. If the Average Response time exceeds that 30-milliseconds constraint, the measurement is invalid.

Clause 9.4.3.7.2
For the Sustainability Test Phase the FDR shall contain:

1. A Data Rate Distribution graph and data table.
2. I/O Request Throughput Distribution graph and data table.
3. A Response Time Frequency Distribution graph and table.
4. An Average Response Time Distribution graph and table.
5. The human readable Test Run Results File produced by the Workload Generator (may be included in an appendix).
6. A listing or screen image of all input parameters supplied to the Workload Generator (may be included in an appendix).
7. The Measured Intensity Multiplier for each I/O stream.
8. The variability of the Measured Intensity Multiplier, as defined in Clause 5.3.13.3.
SPC-1 Workload Generator Input Parameters

The SPC-1 Workload Generator input parameters for the Sustainability, IOPS, Response Time Ramp, Repeatability, and Persistence Test Runs are documented in Appendix E: SPC-1 Workload Generator Input Parameters on Page 72.

**Sustainability – Response Time Frequency Distribution Graph**

The graph shows the distribution of response times for different categories: Read, Write, and All ASUs. The x-axis represents response time in milliseconds, and the y-axis represents the number of occurrences.
Sustainability – Measured Intensity Multiplier and Coefficient of Variation

Clause 3.4.3

**IM – Intensity Multiplier:** The ratio of I/Os for each I/O stream relative to the total I/Os for all I/O streams (ASU1-1 – ASU3-1) as required by the benchmark specification.

**Clauses 5.1.10 and 5.3.15.2**

**MIM – Measured Intensity Multiplier:** The Measured Intensity Multiplier represents the ratio of measured I/Os for each I/O stream relative to the total I/Os measured for all I/O streams (ASU1-1 – ASU3-1). This value may differ from the corresponding Expected Intensity Multiplier by no more than 5%.

**Clause 5.3.15.3**

**COV – Coefficient of Variation:** This measure of variation for the Measured Intensity Multiplier cannot exceed 0.2.

Primary Metrics Test – IOPS Test Phase

Clause 5.4.4.2

The IOPS Test Phase consists of one Test Run at the 100% load point with a Measurement Interval of ten (10) minutes. The IOPS Test Phase immediately follows the Sustainability Test Phase without any interruption or manual intervention.

The IOPS Test Run generates the SPC-1 IOPSTM primary metric, which is computed as the I/O Request Throughput for the Measurement Interval of the IOPS Test Run.

The Average Response Time is computed for the IOPS Test Run and cannot exceed 30 milliseconds. If the Average Response Time exceeds the 30 millisecond constraint, the measurement is invalid.

Clause 9.4.3.7.3

For the IOPS Test Phase the FDR shall contain:

1. I/O Request Throughput Distribution (data and graph).
3. An Average Response Time Distribution.
4. The human readable Test Run Results File produced by the Workload Generator.
5. A listing or screen image of all input parameters supplied to the Workload Generator.
6. The total number of I/O Requests completed in the Measurement Interval as well as the number of I/O Requests with a Response Time less than or equal to 30 milliseconds and the number of I/O Requests with a Response Time greater than 30 milliseconds.

SPC-1 Workload Generator Input Parameters

The SPC-1 Workload Generator input parameters for the Sustainability, IOPS, Response Time Ramp, Repeatability, and Persistence Test Runs are documented in Appendix E: SPC-1 Workload Generator Input Parameters on Page 72.

IOPS Test Results File

A link to the test results file generated from the IOPS Test Run is listed below.

IOPS Test Run – Measured Intensity Multiplier and Coefficient of Variation

Clause 3.4.3

**IM – Intensity Multiplier:** The ratio of I/Os for each I/O stream relative to the total I/Os for all I/O streams (ASU1-1 – ASU3-1) as required by the benchmark specification.

Clauses 5.1.10 and 5.3.15.2

**MIM – Measured Intensity Multiplier:** The Measured Intensity Multiplier represents the ratio of measured I/Os for each I/O stream relative to the total I/Os measured for all I/O streams (ASU1-1 – ASU3-1). This value may differ from the corresponding Expected Intensity Multiplier by no more than 5%.

Clause 5.3.15.3

**COV – Coefficient of Variation:** This measure of variation for the Measured Intensity Multiplier cannot exceed 0.2.

Primary Metrics Test – Response Time Ramp Test Phase

Clause 5.4.4.3

The Response Time Ramp Test Phase consists of five Test Runs, one each at 95%, 90%, 80%, 50%, and 10% of the load point (100%) used to generate the SPC-1 IOPSTM primary metric. Each of the five Test Runs has a Measurement Interval of ten (10) minutes. The Response Time Ramp Test Phase immediately follows the IOPS Test Phase without any interruption or manual intervention.

The five Response Time Ramp Test Runs, in conjunction with the IOPS Test Run (100%), demonstrate the relationship between Average Response Time and I/O Request Throughput for the Tested Storage Configuration (TSC) as illustrated in the response time/throughput curve on page 16.

In addition, the Average Response Time measured during the 10% Test Run is the value for the SPC-1 LRT™ metric. That value represents the Average Response Time of a lightly loaded TSC.

Clause 9.4.3.7.4

The following content shall appear in the FDR for the Response Time Ramp Phase:

1. A Response Time Ramp Distribution.
2. The human readable Test Run Results File produced by the Workload Generator for each Test Run within the Response Time Ramp Test Phase.
3. For the 10% Load Level Test Run (SPC-1 LRT™ metric) an Average Response Time Distribution.
4. A listing or screen image of all input parameters supplied to the Workload Generator.

SPC-1 Workload Generator Input Parameters

The SPC-1 Workload Generator input parameters for the Sustainability, IOPS, Response Time Ramp, Repeatability, and Persistence Test Runs are documented in Appendix E: SPC-1 Workload Generator Input Parameters on Page 72.

Response Time Ramp Test Results File

10% Load Level
Response Time Ramp Distribution (IOPS) Data

The five Test Runs that comprise the Response Time Ramp Phase are executed at 95%, 90%, 80%, 50%, and 10% of the Business Scaling Unit (BSU) load level used to produce the SPC-1 IOPSTM primary metric. The 100% BSU load level is included in the following Response Time Ramp data table and graph for completeness.

### SPC-1 LRT™ Average Response Time (ms) Distribution Graph

![Average Response Time Distribution Graph](image-url)
SPC-1 LRT™ (10%) – Measured Intensity Multiplier and Coefficient of Variation

Clause 3.4.3

**IM – Intensity Multiplier:** The ratio of I/Os for each I/O stream relative to the total I/Os for all I/O streams (ASU1-1 – ASU3-1) as required by the benchmark specification.

Clauses 5.1.10 and 5.3.15.2

**MIM – Measured Intensity Multiplier:** The Measured Intensity Multiplier represents the ratio of measured I/Os for each I/O stream relative to the total I/Os measured for all I/O streams (ASU1-1 – ASU3-1). This value may differ from the corresponding Expected Intensity Multiplier by no more than 5%.

Clause 5.3.15.3

**COV – Coefficient of Variation:** This measure of variation for the Measured Intensity Multiplier cannot exceed 0.2.

Repeatability Test

Clause 5.4.5

The Repeatability Test demonstrates the repeatability and reproducibility of the SPC-1 IOPSTM primary metric and the SPC-1 LRT™ metric generated in earlier Test Runs.

There are two identical Repeatability Test Phases. Each Test Phase contains two Test Runs. Each of the Test Runs will have a Measurement Interval of no less than ten (10) minutes. The two Test Runs in each Test Phase will be executed without interruption or any type of manual intervention.

The first Test Run in each Test Phase is executed at the 10% load point. The Average Response Time from each of the Test Runs is compared to the SPC-1 LRT™ metric. Each Average Response Time value must be less than the SPC-1 LRT™ metric plus 5% or less than the SPC-1 LRT™ metric plus one (1) millisecond (ms).

The second Test Run in each Test Phase is executed at the 100% load point. The I/O Request Throughput from the Test Runs is compared to the SPC-1 IOPSTM primary metric. Each I/O Request Throughput value must be greater than the SPC-1 IOPSTM primary metric minus 5%. In addition, the Average Response Time for each Test Run cannot exceed 30 milliseconds.

If any of the above constraints are not met, the benchmark measurement is invalid.

Clause 9.4.3.7.5

The following content shall appear in the FDR for each Test Run in the two Repeatability Test Phases:

1. A table containing the results of the Repeatability Test.
2. An I/O Request Throughput Distribution graph and table.
3. An Average Response Time Distribution graph and table.
4. The human readable Test Run Results File produced by the Workload Generator.
5. A listing or screen image of all input parameters supplied to the Workload Generator.

SPC-1 Workload Generator Input Parameters

The SPC-1 Workload Generator input parameters for the Sustainability, IOPS, Response Time Ramp, Repeatability, and Persistence Test Runs are documented in Appendix E: SPC-1 Workload Generator Input Parameters on Page 72.
Repeatability Test Results File

The values for the SPC-1 IOPS™, SPC-1 LRT™, and the Repeatability Test measurements are listed in the tables below.

<table>
<thead>
<tr>
<th></th>
<th>SPC-1 IOPS™</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Metrics</td>
<td>55,235.28</td>
</tr>
<tr>
<td>Repeatability Test Phase 1</td>
<td>55,258.88</td>
</tr>
<tr>
<td>Repeatability Test Phase 2</td>
<td>55,263.91</td>
</tr>
</tbody>
</table>

The SPC-1 IOPS™ values in the above table were generated using 100% of the specified Business Scaling Unit (BSU) load level. Each of the Repeatability Test Phase values for SPC-1 IOPS™ must be greater than 95% of the reported SPC-1 IOPS™ Primary Metric.

<table>
<thead>
<tr>
<th></th>
<th>SPC-1 LRT™</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Metrics</td>
<td>0.30 ms</td>
</tr>
<tr>
<td>Repeatability Test Phase 1</td>
<td>0.30 ms</td>
</tr>
<tr>
<td>Repeatability Test Phase 2</td>
<td>0.30 ms</td>
</tr>
</tbody>
</table>

The average response time values in the SPC-1 LRT™ column were generated using 10% of the specified Business Scaling Unit (BSU) load level. Each of the Repeatability Test Phase values for SPC-1 LRT™ must be less than 105% of the reported SPC-1 LRT™ Primary Metric or less than the reported SPC-1 LRT™ Primary Metric plus one (1) millisecond (ms).

A link to the test result file generated from each Repeatability Test Run is listed below.

- Repeatability Test Phase 1, Test Run 1 (LRT)
- Repeatability Test Phase 1, Test Run 2 (IOPS)
- Repeatability Test Phase 2, Test Run 1 (LRT)
- Repeatability Test Phase 2, Test Run 2 (IOPS)

## Repeatability 2 IOPS –Average Response Time (ms) Distribution Graph

![Graph showing average response time distribution over measurement intervals.](image)
### Repeatability 1 (LRT)
**Measured Intensity Multiplier and Coefficient of Variation**

**Clause 3.4.3**

**IM – Intensity Multiplier:** The ratio of I/Os for each I/O stream relative to the total I/Os for all I/O streams (ASU1-1 – ASU3-1) as required by the benchmark specification.

**Clauses 5.1.10 and 5.3.15.2**

**MIM – Measured Intensity Multiplier:** The Measured Intensity Multiplier represents the ratio of measured I/Os for each I/O stream relative to the total I/Os measured for all I/O streams (ASU1-1 – ASU3-1). This value may differ from the corresponding Expected Intensity Multiplier by no more than 5%.

**Clause 5.3.15.3**

**COV – Coefficient of Variation:** This measure of variation for the Measured Intensity Multiplier cannot exceed 0.2.

Data Persistence Test

Clause 6
The Data Persistence Test demonstrates the Tested Storage Configuration (TSC):

- Is capable of maintain data integrity across a power cycle.
- Ensures the transfer of data between Logical Volumes and host systems occurs without corruption or loss.

The SPC-1 Workload Generator will write 16 block I/O requests at random over the total Addressable Storage Capacity of the TSC for ten (10) minutes at a minimum of 25% of the load used to generate the SPC-1 IOPS™ primary metric. The bit pattern selected to be written to each block as well as the address of the block will be retained in a log file.

The Tested Storage Configuration (TSC) will be shutdown and restarted using a power off/power on cycle at the end of the above sequence of write operations. In addition, any caches employing battery backup must be flushed/emptied.

The SPC-1 Workload Generator will then use the above log file to verify each block written contains the correct bit pattern.

Clause 9.4.3.8
The following content shall appear in this section of the FDR:

1. A listing or screen image of all input parameters supplied to the Workload Generator.
2. For the successful Data Persistence Test Run, a table illustrating key results. The content, appearance, and format of this table are specified in Table 9-12. Information displayed in this table shall be obtained from the Test Run Results File referenced below in #3.
3. For the successful Data Persistence Test Run, the human readable Test Run Results file produced by the Workload Generator (may be contained in an appendix).

SPC-1 Workload Generator Input Parameters
The SPC-1 Workload Generator input parameters for the Sustainability, IOPS, Response Time Ramp, Repeatability, and Persistence Test Runs are documented in Appendix E: SPC-1 Workload Generator Input Parameters on Page 72.

Data Persistence Test Results File
A link to each test result file generated from each Data Persistence Test is listed below.

</tr>
</tbody>
</table>

In some cases the same address was the target of multiple writes, which resulted in more Logical Blocks Written than Logical Blocks Verified. In the case of multiple writes to the same address, the pattern written and verified must be associated with the last write to that address.
**PRICED STORAGE CONFIGURATION AVAILABILITY DATE**

*Clause 9.4.3.9*

The committed delivery data for general availability (Availability Date) of all products that comprise the Priced Storage Configuration must be reported. When the Priced Storage Configuration includes products or components with different availability dates, the reported Availability Date for the Priced Storage Configuration must be the date at which all components are committed to be available.

The Fujitsu Storage Systems ETERNUS DX100 S3 as documented in this Full Disclosure Report is currently available for customer purchase and shipment.

**PRICING INFORMATION**

*Clause 9.4.3.3.6*

*The Executive Summary shall contain a pricing spreadsheet as documented in Clause 8.3.1.*

Pricing information may be found in the Priced Storage Configuration Pricing section on page 17.

**TESTED STORAGE CONFIGURATION (TSC) AND PRICED STORAGE CONFIGURATION DIFFERENCES**

*Clause 9.4.3.3.8*

*The Executive Summary shall contain a list of all differences between the Tested Storage Configuration (TSC) and the Priced Storage Configuration.*

A list of all differences between the Tested Storage Configuration (TSC) and Priced Storage Configuration may be found in the Executive Summary portion of this document on page 17.

**ANOMALIES OR IRREGULARITIES**

*Clause 9.4.3.10*

*The FDR shall include a clear and complete description of any anomalies or irregularities encountered in the course of executing the SPC-1 benchmark that may in any way call into question the accuracy, verifiability, or authenticity of information published in this FDR.*

There were no anomalies or irregularities encountered during the SPC-1 Remote Audit of the Fujitsu Storage Systems ETERNUS DX100 S3.
APPENDIX A: SPC-1 GLOSSARY

“Decimal” (powers of ten) Measurement Units

In the storage industry, the terms “kilo”, “mega”, “giga”, “tera”, “peta”, and “exa” are commonly used prefixes for computing performance and capacity. For the purposes of the SPC workload definitions, all of the following terms are defined in “powers of ten” measurement units.

- A kilobyte (KB) is equal to $1,000 \times 10^3$ bytes.
- A megabyte (MB) is equal to $1,000,000 \times 10^6$ bytes.
- A gigabyte (GB) is equal to $1,000,000,000 \times 10^9$ bytes.
- A terabyte (TB) is equal to $1,000,000,000,000 \times 10^{12}$ bytes.
- A petabyte (PB) is equal to $1,000,000,000,000,000 \times 10^{15}$ bytes.
- An exabyte (EB) is equal to $1,000,000,000,000,000,000 \times 10^{18}$ bytes.

“Binary” (powers of two) Measurement Units

The sizes reported by many operating system components use “powers of two” measurement units rather than “power of ten” units. The following standardized definitions and terms are also valid and may be used in this document.

- A kibibyte (KiB) is equal to $1,024 \times 2^{10}$ bytes.
- A mebibyte (MiB) is equal to $1,048,576 \times 2^{20}$ bytes.
- A gibibyte (GiB) is equal to $1,073,741,824 \times 2^{30}$ bytes.
- A tebibyte (TiB) is equal to $1,099,511,627,776 \times 2^{40}$ bytes.
- A pebibyte (PiB) is equal to $1,125,899,906,842,624 \times 2^{50}$ bytes.
- An exbibyte (EiB) is equal to $1,152,921,504,606,846,967 \times 2^{60}$ bytes.

SPC-1 Data Repository Definitions

Total ASU Capacity: The total storage capacity read and written in the course of executing the SPC-1 benchmark.

Application Storage Unit (ASU): The logical interface between the storage and SPC-1 Workload Generator. The three ASUs (Data, User, and Log) are typically implemented on one or more Logical Volume.

Logical Volume: The division of Addressable Storage Capacity into individually addressable logical units of storage used in the SPC-1 benchmark. Each Logical Volume is implemented as a single, contiguous address space.

Addressable Storage Capacity: The total storage (sum of Logical Volumes) that can be read and written by application programs such as the SPC-1 Workload Generator.
**Configured Storage Capacity:** This capacity includes the Addressable Storage Capacity and any other storage (parity disks, hot spares, etc.) necessary to implement the Addressable Storage Capacity.

**Physical Storage Capacity:** The formatted capacity of all storage devices physically present in the Tested Storage Configuration (TSC).

**Data Protection Overhead:** The storage capacity required to implement the selected level of data protection.

**Required Storage:** The amount of Configured Storage Capacity required to implement the Addressable Storage Configuration, excluding the storage required for the three ASUs.

**Global Storage Overhead:** The amount of Physical Storage Capacity that is required for storage subsystem use and unavailable for use by application programs.

**Total Unused Storage:** The amount of storage capacity available for use by application programs but not included in the Total ASU Capacity.

**SPC-1 Data Protection Levels**

**Protected 1:** The single point of failure of any *storage device* in the configuration will not result in permanent loss of access to or integrity of the SPC-1 Data Repository.

**Protected 2:** The single point of failure of any *component* in the configuration will not result in permanent loss of access to or integrity of the SPC-1 Data Repository.

**SPC-1 Test Execution Definitions**

**Average Response Time:** The sum of the Response Times for all Measured I/O Requests divided by the total number of Measured I/O Requests.

**Completed I/O Request:** An I/O Request with a Start Time and a Completion Time (see “I/O Completion Types” below).

**Completion Time:** The time recorded by the Workload Generator when an I/O Request is satisfied by the TSC as signaled by System Software.

**Data Rate:** The data transferred in all Measured I/O Requests in an SPC-1 Test Run divided by the length of the Test Run in seconds.

**Expected I/O Count:** For any given I/O Stream and Test Phase, the product of 50 times the BSU level, the duration of the Test Phase in seconds, and the Intensity Multiplier for that I/O Stream.

**Failed I/O Request:** Any I/O Request issued by the Workload Generator that could not be completed or was signaled as failed by System Software. A Failed I/O Request has no Completion Time (see “I/O Completion Types” below).
**I/O Request Throughput:** The total number of Measured I/O requests in an SPC-1 Test Run divided by the duration of the Measurement Interval in seconds.

**In-Flight I/O Request:** An I/O Request issued by the I/O Command Generator to the TSC that has a recorded Start Time, but does not complete within the Measurement Interval (see “I/O Completion Types” below).

**Measured I/O Request:** A Completed I/O Request with a Completion Time occurring within the Measurement Interval (see “I/O Completion Types” below).

**Measured Intensity Multiplier:** The percentage of all Measured I/O Requests that were issued by a given I/O Stream.

**Measurement Interval:** The finite and contiguous time period, after the TSC has reached Steady State, when data is collected by a Test Sponsor to generate an SPC-1 test result or support an SPC-1 test result.

**Ramp-Up:** The time required for the Benchmark Configuration (BC) to produce Steady State throughput after the Workload Generator begins submitting I/O Requests to the TSC for execution.

**Ramp-Down:** The time required for the BC to complete all I/O Requests issued by the Workload Generator. The Ramp-Down period begins when the Workload Generator ceases to issue new I/O Requests to the TSC.

**Response Time:** The Response Time of a Measured I/O Request is its Completion Time minus its Start Time.

**Start Time:** The time recorded by the Workload Generator when an I/O Request is submitted, by the Workload Generator, to the System Software for execution on the Tested Storage Configuration (TSC).

**Start-Up:** The period that begins after the Workload Generator starts to submit I/O requests to the TSC and ends at the beginning of the Measurement Interval.

**Shut-Down:** The period between the end of the Measurement Interval and the time when all I/O Requests issued by the Workload Generator have completed or failed.

**Steady State:** The consistent and sustainable throughput of the TSC. During this period the load presented to the TSC by the Workload Generator is constant.

**Test:** A collection of Test Phases and or Test Runs sharing a common objective.

**Test Run:** The execution of SPC-1 for the purpose of producing or supporting an SPC-1 test result. SPC-1 Test Runs may have a finite and measured Ramp-Up period, Start-Up period, Shut-Down period, and Ramp-Down period as illustrated in the “SPC-1 Test Run Components” below. All SPC-1 Test Runs shall have a Steady State period and a Measurement Interval.
**Test Phase:** A collection of one or more SPC-1 Test Runs sharing a common objective and intended to be run in a specific sequence.

APPENDIX B: CUSTOMER TUNABLE PARAMETERS AND OPTIONS

QLogic HBA Driver

The following parameter was set in the QLogic HBA driver configuration file, `qla2xxx.conf`, to set the maximum queue depth to 128 from the default of 32:

```
options qla2xxx ql2xmaxqdepth=128
```

The file was copied to the `/etc/modprobe.d/` directory in the Host System and the system was rebooted to set the queue depth in all of the installed HBAs.
APPENDIX C: TESTED STORAGE CONFIGURATION (TSC) CREATION

The standard Fujitsu Command Line tool (CLI) was used to create the ETERNUS DX600 S3 SPC-1 configuration.

The ‘master’ script, doFDRcfg.sh, was executed, which in turn, invoked the script, DX100S3_20140618.exp. The ‘master’ script included shell commands to monitor the progress as the physical formatting proceeded, which used the `expect` script showFormatStatus.exp to pick up the status information from the array.

The DX100S3_20140618.exp script completed steps 1-3, described below for the 6 host port configuration.

Each `expect` script included the `docli` procedure, which was used to issue the CLI commands to the array. That procedure used `ssh` for communication with the array. A second procedure in the script, `doexit`, was used to conclude the execution sequence at the end of the script.

**Step 1 – Creation of RAID Groups**

A total of 4 RAID Groups were created, according to the configuration plan, DX100-200 S3 Design Views - SPC-1_Option_R1x4_SSD.xlsx, which is typically prepared in concert with a Fujitsu SE. Each RAID Group was made up of 2 disk drives in a RAID1(1+1) configuration and assigned to a specific CM for operational control. The RAID Groups were named RG00 through RG03.

**Step 2 – Creation of the Logical Volumes**

Wide striped logical volumes were created across 2 sets of RAID Groups (each with 2 RAID Groups). Three volumes were created on each of the RAID Groups, one for each of the three ASUs, for a total of 6 logical volumes. The sizes of two volumes created on the 2 sets for ASU-1 and ASU-2 were set to 258,048 MiB (270,582 MB) each. The size of the volumes on the 2 sets for ASU-3 was set to 57,344 MiB (60,130 MB) each.

**Step 3 – Assignment of LUN Mapping to the Linux Host Systems**

The DX100S3_20140618.exp script provided mapping to 6 host ports.

Port LUN mapping was assigned for each of the Logical Volumes using three ports on each of the two Controller Modules (CM). Each of the volumes, which were defined on RAID Groups, owned by CM-0, were assigned LUN numbers on the active ports (2 on one Channel Adapter (CA), and 1 on the other CA) on CM-0. Each of the volumes, which were defined on RAID Groups, owned by CM-1, were assigned LUN numbers on the active ports (2 on one CA and 1 on the other CA) on CM-1.

APPENDIX D: SPC-1 WORKLOAD GENERATOR STORAGE COMMANDS AND PARAMETERS

ASU Pre-Fill

The content of command and parameter file, used in this benchmark to execute the required ASU pre-fill, is listed below.

* Prefill vdbench parameter file for SPC1 DX100S3 2014/06/18
* This will produce a random data pattern of the entire LBA range using LSFR
* compratio=1
* openflags=directio is specified for linux since vdbench requires this when /dev is used
* size parameter is also specified because linux version of vdbench requires it
sd=asu1_1,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200030000,size=252g,threads=32,openflags=directio
sd=asu1_2,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200000000,size=252g,threads=32,openflags=directio
sd=asu2_1,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200020000,size=252g,threads=32,openflags=directio
sd=asu2_2,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200050000,size=252g,threads=32,openflags=directio
sd=asu3_1,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200010000,size=56g,threads=32,openflags=directio
sd=asu3_2,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200040000,size=56g,threads=32,openflags=directio
* wd=wd1,sd=asu1_1,rdpct=0,seek=-1,xfersize=128K
wd=wd2,sd=asu3_1,rdpct=0,seek=-1,xfersize=128K
wd=wd3,sd=asu2_1,rdpct=0,seek=-1,xfersize=128K
wd=wd4,sd=asu1_2,rdpct=0,seek=-1,xfersize=128K
wd=wd5,sd=asu3_2,rdpct=0,seek=-1,xfersize=128K
wd=wd6,sd=asu2_2,rdpct=0,seek=-1,xfersize=128K
* Use 10 hours as a maximum elapsed time,
* which should ensure the entire LBA range will be written before the time elapses
* rd=asu_prefill,wd=wd*,iorate=max,elapsed=36000,interval=10
* The above "elapsed=36000" may have to be increased to ensure that the utility will reach
* the end of the LUN ("seek=-1") prior to the end of the specified elapsed time
Primary Metrics and Repeatability Tests

The content of SPC-1 Workload Generator command and parameter file used in this benchmark to execute the Primary Metrics (*Sustainability Test Phase, IOPS Test Phase, and Response Time Ramp Test Phase*) and Repeatability (*Repeatability Test Phase 1 and Repeatability Test Phase 2*) Tests is listed below.

```
host=master
slaves=(slave1,slave2,slave3,slave4,slave5,slave6,slave7,slave8,slave9,slave10,slave11,slave12,slave13,slave14,slave15,slave16,slave17,slave18,slave19,slave20,slave21,slave22,slave23,slave24,slave25)
javaparms="-Xmx3072m -Xms3072m -Xss512k"
sd=asu1_1,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200030000,size=252g
sd=asu1_2,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200000000,size=252g

sd=asu2_2,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200050000,size=252g
sd=asu3_1,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200100000,size=56g
sd=asu3_2,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200400000,size=56g
```

SPC-1 Persistence Test

The content of SPC-1 Workload Generator command and parameter file used in this benchmark to execute the SPC-1 Persistence Test (*write and read phases*) is listed below.

```
javaparms="-Xmx3072m -Xms3072m -Xss512k"
sd=asu1_1,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200030000,size=252g
sd=asu1_2,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200000000,size=252g
sd=asu2_1,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200020000,size=252g
sd=asu2_2,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200050000,size=252g
sd=asu3_1,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200100000,size=56g
sd=asu3_2,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200400000,size=56g
```
**Slave JVMs**

Each Slave JVM was invoked with a command and parameter file similar to the example listed below. The only difference in each file was the **host** parameter value, which was unique to each Slave JVM, e.g. `slave1…slave25`.

```
master=masterh
host=slave1
javaparms="-Xmx3072m -Xms3072m -Xss512k"

sd=asul_1,lun=/dev/disk/by-id/scsi-3600000e00d28000000281122000300000, size=252g
sd=asul_2,lun=/dev/disk/by-id/scsi-3600000e00d28000000281122000000000, size=252g
sd=asul_2,lun=/dev/disk/by-id/scsi-3600000e00d28000000281122000200000, size=252g
sd=asul_2,lun=/dev/disk/by-id/scsi-3600000e00d28000000281122000500000, size=252g

sd=asul_2,lun=/dev/disk/by-id/scsi-3600000e00d28000000281122000400000, size=56g
```
‘Master’ Execution Script

The ‘master’ script, doFDRall_1H.sh, was used to execute the required ASU pre-fill, Primary Metrics Test (Sustainability Test Phase, IOPS Test Phase, and Response Time Ramp Test Phase), Repeatability Test (Repeatability Test Phase 1 and Repeatability Test Phase 2) and SPC-1 Persistence Test Run 1 (write phase) in an uninterrupted sequence.

After the above test sequence completed, the required TSC power off/power was performed. That step was followed by execution of the doFDRall_2H.sh script, which was used to perform SPC-1 Persistence Test Run 2 (read phase).

The doFDRall_1H.sh and doFDRall_2H.sh scripts invoked various other scripts which appear below in the Referenced Scripts and Files section with a brief description of each referenced script.

doFDRall_1H.sh

```bash
#!/bin/bash -x
#
# Script consists of Part 1 of the FDR job
# - Prefill
# - Save "Before FDR" logs
# - Metrics
# - Repeatability1/2

Referenced Scripts and Files

Setup2FDRH.sh

Invoked from doFDRall_1H.sh. This script will create the following files using the manually created file, spc1-device.cfg, as input:
• **slave_header.txt**: The header text for each of the Slave JVM configuration files.

• **spc1_master_header.txt**: The header text for the SPC-1 Workload Generator command and parameter file (spc1.cfg).

• **spc1.cfg**: The SPC-1 Workload Generator command and parameter file used for the Primary Metrics and Repeatability Tests.

• **persspc1.cfg**: The SPC-1 Workload Generator command and parameter file used for the reduced level SPC-1 Persistence Test Run 1.

```
#!/bin/bash
#
# Setup2FDRH.sh  <BSU>
# Setup the parameter files for FDR run
# Called by doFDRall_1H.sh
# Parameter  BSU - BSU used for FDR run
# Input files (generated manually)
#   spc1-device.cfg
#
# Output files:
# slave_header.txt
# spc1_master_header.txt
# spc1.cfg
# persspc1.cfg
#
# Environment Variables
# SCRIPTS
# JAVAPARMS
# NSLAVES
#
if [ $# != 1 ]
then
  echo "$0 <Bsu>"
  exit
fi
MASTERIP=master
BSU=$1
SCRIPTS=/home/spc1/fdr/fdrwork/7_Execution
cd $SCRIPTS
# Create header for slave configuration file
cat > slave_header.txt << HERE
master=$MASTERIP
host=#slave1#
javaparms="$JAVAPARMS"
HERE
SLAVELIST=""
# Create header for master configuration file
for (( i=1; i<=NSLAVES; i++ ))
do
  SLAVELIST=${SLAVELIST}slave${i}
  if [ $i != $NSLAVES ]
    then
      SLAVELIST="${SLAVELIST},"
  fi
done
cat > spc1_master_header.txt << HERE
host=master
slaves="${SLAVELIST}"
javaparms="$JAVAPARMS"
HERE
cat spc1_master_header.txt spc1-device.cfg > spc1.cfg
```
spc1-device.cfg

Created manually and used by Setup2FDRH.sh and setup_slave_dirsH.sh to create various configuration files.

sd=asu1_1,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200030000,size=252g
sd=asu1_2,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200050000,size=252g
sd=asu2_1,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200020000,size=252g
sd=asu2_2,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200050000,size=252g

sd=asu3_2,lun=/dev/disk/by-id/scsi-3600000e00d2800000028112200040000,size=56g

spc1_master_header.txt

Created by Setup2FDRH.sh.

host=master
slaves=(slave1,slave2,slave3,slave4,slave5,slave6,slave7,slave8,slave9,slave10,slave
11,slave12,slave13,slave14,slave15,slave16,slave17,slave18,slave19,slave20,slave21,s
lave22,slave23,slave24,slave25)
javaparms="-Xmx3072m -Xms3072m -Xss512k"

setup_slave_dirsH.sh

Invoked from doFDRall_1H.sh. This script uses slave_header.txt, which was created by
Setup2FDRH.sh, and spc1-device.cfg as input to create each Slave JVM configuration file
and a directory for each Slave JVM's execution output.

#!/bin/bash
# setup_slave_dirsH <jobID> <STEP>
# Create the work directory and slave sub directory for each step
# environment
# $ROOT
# $WORKDIR
# $SCRIPTS
# $NSLAVES
# parameter jobID STEP
jobID=$1
STEP=$2
cd $WORKDIR
mkdir $STEP
cd $STEP
# create separate directory and slave cfg files under each slave<n>/slave<n>.txt
for (( i=1; i<=$NSLAVES ; i++ ))
do
    mkdir slave${i}
cat $SCRIPTS/slave_header.txt $SCRIPTS/spc1-device.cfg | sed s/##slave1##/slave${i}/ > slave${i}/slave${i}.txt
done
slave_header.txt

Created by Setup2FDRH.sh and used by setup_slave_dirsH.sh.

master=masterh
host=#slave1#
javaparms="-Xmx3072m -Xms3072m -Xss512k"

start_slavesH.sh

Invoked from doFDRall_1H.sh to start all Slave JVMs prior to each SPC-1 Test or Test Phase execution.

#!/bin/bash -x

STEP=$1
cd $WORKDIR
cd $STEP

# Create Config file of slave
# for (( i=1; i<=($NSLAVES)); i++ ))
do
  (cd slave${i};java ${JAVAPARMS} spc1 -f slave${i}.txt &>
slave${i}_console_out.txt) &
sleep 1
done

stop_slaves.sh

Invoked from doFDRall_1H.sh to stop all Slave JVMs after each SPC-1 Test or Test Phase terminates.

ssh slaveh1 'pkill java'
