AUDIT CERTIFICATION

Steve Daniel NetApp, Inc. 7301 Kit Creek Road, Building 1 Research Triangle Park, NC 27709

March 17, 2008

The SPC Benchmark 1TM results listed below for the NetApp FAS3040 were produced in compliance with the SPC Benchmark 1TM V1.10.1 Remote Audit requirements.

SPC Benchmark 1™ V1.10.1 Results				
Tested Storage Configuration (TSC) Name: NetApp FAS3040				
Metric Reported Result				
SPC-1 IOPS™	30,992.39			
SPC-1 Price-Performance	\$13.58/SPC-1 IOPS™			
Total ASU Capacity	12,586.586 GB			
Data Protection Level Other Data Protection (NetApp RAID DP™)				
Total TSC Price (including three-year maintenance)	\$420,800			

The following SPC Benchmark 1^{TM} Remote Audit requirements were reviewed and found compliant with V1.10.1 of the SPC Benchmark 1^{TM} specification:

- · A Letter of Good Faith, signed by a senior executive.
- The following Data Repository storage items were verified by information supplied by NetApp, Inc.:
 - ✓ Physical Storage Capacity and requirements.
 - ✓ Configured Storage Capacity and requirements.
 - ✓ Addressable Storage Capacity and requirements.
 - ✓ Capacity of each Logical Volume and requirements.
- ✓ Capacity of each Application Storage Unit (ASU) and requirements.
- An appropriate diagram of the Benchmark Configuration (BC)/Tested Storage Configuration (TSC).
- Listings and commands to configure the Benchmark Configuration/Tested Storage Configuration, including customer tunable parameters.
- · Commands and parameters used to configure the SPC-1 Workload Generator.

Storage Performance Council 643 Bair Island Road, Suite 103 Redwood City, CA 94062 <u>AuditService@storageperformance.org</u> 650,556,9384

NetApp, Inc.

AUDIT CERTIFICATION (CONT.)

NetApp FAS3040 SPC-1 Audit Certification Page 2

- · The following Host System requirements were verified by information supplied by NetApp, Inc.:
 - ✓ The type of Host System including the number of processors and main memory.
 - ✓ The presence and version number of the Workload Generator on the Host System.
 - ✓ The TSC boundary within the Host System.
- The execution of each Test, Test Phase, and Test Run was observed and found compliant with all of the requirements and constraints of Clauses 4 and 5 of the SPC-1 Benchmark Specification.
- The Test Results Files and resultant Summary Results Files received from NetApp, Inc. for each of
 following were authentic, accurate, and compliant with all of the requirements and constraints of
 Clauses 4 and 5 of the SPC-1 Benchmark Specification:
 - ✓ Data Persistence Test
 - ✓ Sustainability Test Phase
 - ✓ IOPS Test Phase
 - ✓ Response Time Ramp Test Phase
 - ✓ Repeatability Test
- There were no differences between the Tested Storage Configuration (TSC) used for the benchmark and Priced Storage Configuration.
- The submitted pricing information met all of the requirements and constraints of Clause 8 of the SPC-1 Benchmark Specification.
- The Full Disclosure Report (FDR) met all of the requirements in Clause 9 of the SPC-1 Benchmark Specification.
- This successfully audited SPC measurement is not subject to an SPC Confidential Review.

Audit Notes:

There were no audit notes or exceptions.

Walter E. Baker

Respectfully,

Walter E. Baker SPC Auditor

Storage Performance Council 643 Bair Island Road, Suite 103 Redwood City, CA 94062 <u>AuditService@storageperformance.org</u> 650.556.9384

LETTER OF GOOD FAITH

7 January, 2008

Walter Baker Gradient Systems 643 Blair Island Road, Suite 103 Redwood City, CA 94063-2755

To: Walter Baker

Subject: SPC-1 Letter of Good Faith for the NetApp FAS3040

Network Appliance, Inc is the SPC-1 Test Sponsor for the above listed product. To the best of our knowledge and belief, the required SPC-1 benchmark results and materials we have submitted for that product are complete, accurate, and in full compliance with V1.10.1 of the SPC-1 benchmark specification.

In addition, we have reported any items in the Benchmark Configuration and execution of the benchmark that affected the reported results even if the items are not explicitly required to be disclosed by the SPC-1 benchmark specification.

Sincerely,

Phil Brotherton

Vice President

Enterprise Applications Business Unit

Ell Buthit

Tested Storage Product (TSP) Description

The NetApp FAS3040 is the newest entry in the FAS3000 series of Enterprise Storage Systems. The NetApp FAS3000 series delivers outstanding value through excellent performance, best-in-class scalability, and proven lower TCO than other midrange storage systems.

These enterprise storage systems have the versatility to simultaneously meet diverse needs—SAN and NAS, primary and secondary storage—while providing high levels of availability. The FAS3040 system handles complex requirements in a way that actually simplifies the storage infrastructure and improves productivity.

The NetApp FAS3040 delivers excellent performance, whether the storage need is for SAN-based business applications, technical applications, or home directories. With large cache memory configurations, expandable high-performance I/O, 4-gigabit FC SAN support, and support for 10-Gigabit Ethernet, the FAS3040 delivers exceptional midrange systems performance

SPC BENCHMARK 1TM V1.10.1

FULL DISCLOSURE REPORT

NetApp, Inc. NetApp FAS3040 (48-hour Sustainability Test)

EXECUTIVE SUMMARY Page 11 of 69

Summary of Results

SPC-1 Results				
Tested Storage Configuration (TSC) Name: NetApp FAS3040 (48-hour Sustainability Test)				
Metric Reported Result				
SPC-1 IOPS™	30,992.39			
SPC-1 Price-Performance	\$13.58/SPC-1 IOPS™			
Total ASU Capacity	12,586.586 GB			
Data Protection Level	Other Data Protection (NetApp RAID DP™)			
Total TSC Price (including three-year maintenance)	\$420,800			

SPC-1 IOPS™ represents the maximum I/O Request Throughput at the 100% load point.

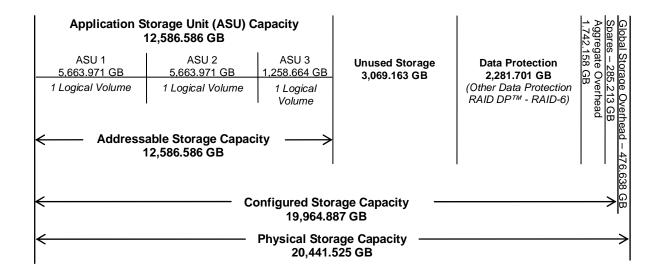

Total ASU (Application Storage Unit) **Capacity** represents the total storage capacity read and written in the course of executing the SPC-1 benchmark.

A **Data Protection Level** of "Other Protection Level" utilized NetApp's RAID-DPTM, a RAID 6 implementation, which provides double-parity RAID protection against data loss with negligible performance overhead and no cost penalty compared to single-parity RAID. Additional information is available at the following location:

http://www.netapp.com/products/software/raid-dp.html

Storage Capacities and Relationships

The following diagram documents the various storage capacities, used in this benchmark, and their relationships.

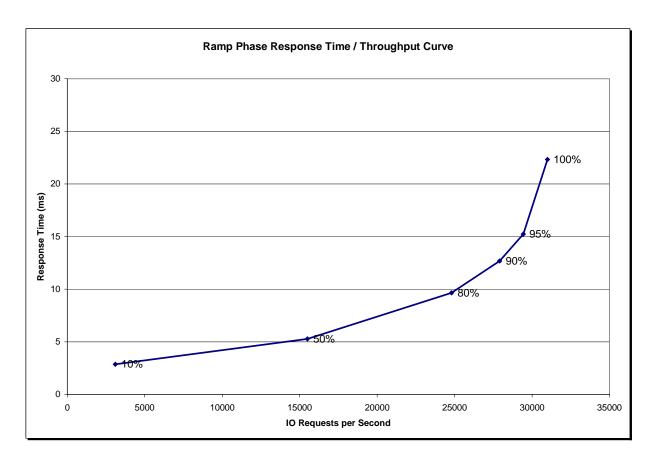

EXECUTIVE SUMMARY Page 12 of 69

Response Time - Throughput Curve

The Response Time-Throughput Curve illustrates the Average Response Time (milliseconds) and I/O Request Throughput at 100%, 95%, 90%, 80%, 50%, and 10% of the workload level used to generate the SPC-1 IOPS $^{\text{TM}}$ metric.

The Average Response Time measured at any of the above load points cannot exceed 30 milliseconds or the benchmark measurement is invalid.

Response Time - Throughput Data

	10% Load	50% Load	80% Load	90% Load	95% Load	100% Load
I/O Request Throughput	3,100.30	15,503.48	24,800.07	27,902.87	29,442.24	30,992.39
Average Response Time (ms):						
All ASUs	2.86	5.27	9.65	12.68	15.23	22.32
ASU-1	3.81	6.69	11.73	15.13	17.92	25.47
ASU-2	3.75	6.88	12.31	15.99	19.05	27.41
ASU-3	0.47	1.56	4.08	6.06	7.83	13.41
Reads	6.12	10.34	17.24	21.68	25.22	34.01
Writes	0.74	1.97	4.70	6.83	8.72	14.70

In each of the following sections of this document, the appropriate Full Disclosure Report requirement, from the SPC-1 benchmark specification, is stated in italics followed by the information to fulfill the stated requirement.

CONFIGURATION INFORMATION

Benchmark Configuration (BC)/Tested Storage Configuration (TSC) Diagram

Clause 9.2.4.4.1

A one page Benchmark Configuration (BC)/Tested Storage Configuration (TSC) diagram shall be included in the Executive Summary...

The Benchmark Configuration (BC)/Tested Storage Configuration (TSC) is illustrated on page 14 (Benchmark Configuration/Tested Storage Configuration Diagram).

Storage Network Configuration

Clause 9.2.4.4.1

...

5. If the TSC contains network storage, the diagram will include the network configuration. If a single diagram is not sufficient to illustrate both the Benchmark Configuration and network configuration in sufficient detail, the Benchmark Configuration diagram will include a high-level network illustration as shown in Figure 9-8. In that case, a separate, detailed network configuration diagram will also be included as described in Clause 9.2.4.4.2.

Clause 9.2.4.4.2

If a storage network was configured as a part of the Tested Storage Configuration and the Benchmark Configuration diagram described in Clause 9.2.4.4.1 contains a high-level illustration of the network configuration, the Executive Summary will contain a one page topology diagram of the storage network as illustrated in Figure 9-9.

The Benchmark Configuration (BC)/Tested Storage Configuration (TSC), including the network configuration, is illustrated on page 14 (Benchmark Configuration/Tested Storage Configuration Diagram).

Host System Configuration

Clause 9.2.4.4.3

The FDR shall minimally contain, for each Host System running the Workload Generator, a listing of the following:

- 1. Number and type of CPUs.
- 2. Main memory capacity.
- 3. Cache memory capacity.
- 4. Number and type of disk controllers or Host Bus Adapters.

The details of the Host System configuration may be found on page 14 (Benchmark Configuration/Tested Storage Configuration Diagram).

SPC BENCHMARK 1TM V1.10.1

FULL DISCLOSURE REPORT

Submitted for Review: MARCH 18, 2008

Customer Tunable Parameters and Options

Clause 9.2.4.5.1

All Benchmark Configuration (BC) components with customer tunable parameter and options that have been altered from their default values must be listed in the FDR. The FDR entry for each of those components must include both the name of the component and the altered value of the parameter or option. If the parameter name is not self-explanatory to a knowledgeable practitioner, a brief description of the parameter's use must also be included in the FDR entry.

"Appendix B: Customer Tunable Parameters and Options" on page 56 contains the customer tunable parameters and options that have been altered from their default values for this benchmark.

Tested Storage Configuration (TSC) Description

Clause 9.2.4.5.2

The FDR must include sufficient information to recreate the logical representation of the TSC. In addition to customer tunable parameters and options (Clause 4.2.4.5.3), that information must include, at a minimum:

- A diagram and/or description of the following:
 - > All physical components that comprise the TSC. Those components are also illustrated in the BC Configuration Diagram in Clause 9.2.4.4.1 and/or the Storage Network Configuration Diagram in Clause 9.2.4.4.2.
 - > The logical representation of the TSC, configured from the above components that will be presented to the Workload Generator.
- Listings of scripts used to create the logical representation of the TSC.
- If scripts were not used, a description of the process used with sufficient detail to recreate the logical representation of the TSC.

"Appendix C: Tested Storage Configuration (TSC) Creation" on page 57 contains the detailed information that describes how to create and configure the logical TSC.

SPC-1 Workload Generator Storage Configuration

Clause 9.2.4.5.3

The FDR must include all SPC-1 Workload Generator storage configuration commands and parameters.

The SPC-1 Workload Generator storage configuration commands and parameters for this measurement appear in "Appendix D: SPC-1 Workload Generator Storage Commands and Parameters" on page 66.

DATA REPOSITORY Page 18 of 69

SPC-1 DATA REPOSITORY

This portion of the Full Disclosure Report presents the detailed information that fully documents the various SPC-1 storage capacities and mappings used in the Tested Storage Configuration. "SPC-1 Data Repository Definitions" on page 52 contains definitions of terms specific to the SPC-1 Data Repository.

Storage Capacities and Relationships

Clause 9.2.4.6.1

Two tables and an illustration documenting the storage capacities and relationships of the SPC-1 Storage Hierarchy (Clause 2.1) shall be included in the FDR.

SPC-1 Storage Capacities

SPC-1 Storage Capacities					
Storage Hierarchy Component	Units	Capacity			
Total ASU Capacity	Gigabytes (GB)	12,586.586			
Addressable Storage Capacity	Gigabytes (GB)	12,586.586			
Configured Storage Capacity	Gigabytes (GB)	19,964.887			
Physical Storage Capacity	Gigabytes (GB)	20,441.525			
Data Protection (Other Data Protection)	Gigabytes (GB)	2,281.701			
Required Storage (spares/metadata)	Gigabytes (GB)	2,027.370			
Global Storage Overhead	Gigabytes (GB)	476.638			
Total Unused Storage	Gigabytes (GB)	3,069.163			

SPC-1 Storage Hierarchy Ratios

	Addressable Storage Capacity	Configured Storage Capacity	Physical Storage Capacity
Total ASU Capacity	100.00%	63.04%	61.57%
Required for Data Protection (Other)		11.43%	11.16%
Addressable Storage Capacity		63.04%	61.57%
Required Storage		10.15%	9.92%
Configured Storage Capacity			97.67%
Global Storage Overhead			2.33%
Unused Storage:			
Addressable	0.00%		
Configured		15.37%	
Physical			0.00%

DATA REPOSITORY Page 19 of 69

The Physical Storage Capacity consisted of 20,441.525 GB distributed over 140 disk drives each with a formatted capacity of 146.011 GB. There was 0.000 GB (0.00%) of Unused Storage within the Physical Storage Capacity. Global Storage Overhead consisted of 476.638 GB (2.33%) of Physical Storage Capacity. There was 3,069.163 GB (15.37%) of Unused Storage within the Configured Storage Capacity. The Total ASU Capacity utilized 100.00% of the Addressable Storage Capacity resulting in 0.000 GB (0.00%) of Unused Storage within the Addressable Storage Capacity.

SPC-1 Storage Capacities and Relationships Illustration

The various storage capacities configured in the benchmark result are illustrated below (not to scale).

Logical Volume Capacity and ASU Mapping

Clause 9.2.4.6.2

A table illustrating the capacity of each ASU and the mapping of Logical Volumes to ASUs shall be provided in the FDR. ... Logical Volumes shall be sequenced in the table from top to bottom per its position in the contiguous address space of each ASU. The capacity of each Logical Volume shall be stated. ... In conjunction with this table, the Test Sponsor shall provide a complete description of the type of data protection (see Clause 2.4.5) used on each Logical Volume.

Logi	Logical Volume Capacity and Mapping								
ASU-1 (5,663.971 GB)	ASU-2 (5,663.971 GB)	ASU-3 (1,258.664 GB)							
1 Logical Volume 5,663.971 GB per Logical Volume (5,663.971 GB used per Logical Volume)	1 Logical Volume 5,663.971 GB per Logical Volume (5,663.971 GB used per Logical Volume)	1 Logical Volume 1,258.664 GB per Logical Volume (1,258.664 GB used per Logical Volume)							

The Data Protection Level used for all Logical Volumes was Other Data Protection as described on page 11. See "ASU Configuration" in the **IOPS Test Results File** for more detailed configuration information.

SPC-1 BENCHMARK EXECUTION RESULTS

This portion of the Full Disclosure Report documents the results of the various SPC-1 Tests, Test Phases, and Test Runs. "SPC-1 Test Execution Definitions" on page 53 contains definitions of terms specific to the SPC-1 Tests, Test Phases, and Test Runs.

Clause 5.4.3

The Tests must be executed in the following sequence: Primary Metrics, Repeatability, and Data Persistence. That required sequence must be uninterrupted from the start of Primary Metrics to the completion of Persistence Test Run 1. Uninterrupted means the Benchmark Configuration shall not be power cycled, restarted, disturbed, altered, or adjusted during the above measurement sequence. If the required sequence is interrupted other than for the Host System/TSC power cycle between the two Persistence Test Runs, the measurement is invalid.

SPC-1 Tests, Test Phases, and Test Runs

The SPC-1 benchmark consists of the following Tests, Test Phases, and Test Runs:

Primary Metrics Test

- > Sustainability Test Phase and Test Run
- > IOPS Test Phase and Test Run
- > Response Time Ramp Test Phase
 - 95% of IOPS Test Run
 - o 90% of IOPS Test Run
 - 80% of IOPS Test Run
 - 50% of IOPS Test Run
 - o 10% of IOPS Test Run (LRT)

Repeatability Test

- > Repeatability Test Phase 1
 - o 10% of IOPS Test Run (LRT)
 - o IOPS Test Run
- Repeatability Test Phase 2
 - o 10% of IOPS Test Run (LRT)
 - o IOPS Test Run

Data Persistence Test

- > Data Persistence Test Run 1
- Data Persistence Test Run 2

Each Test is an atomic unit that must be executed from start to finish before any other Test, Test Phase, or Test Run may be executed.

The results from each Test, Test Phase, and Test Run are listed below along with a more detailed explanation of each component.

Primary Metrics Test - Sustainability Test Phase

Clause 5.4.4.1.1

The Sustainability Test Phase has exactly one Test Run and shall demonstrate the maximum sustainable I/O Request Throughput within at least a continuous three (3) hour Measurement Interval. This Test Phase also serves to insure that the TSC has reached Steady State prior to reporting the final maximum I/O Request Throughput result (SPC-1 $IOPS^{TM}$).

Clause 5.4.4.1.2

The computed I/O Request Throughput of the Sustainability Test must be within 5% of the reported SPC-1 IOPS™ result.

Clause 5.4.4.1.4

The Average Response Time, as defined in Clause 5.1.1, will be computed and reported for the Sustainability Test Run and cannot exceed 30 milliseconds. If the Average Response time exceeds that 30-milliseconds constraint, the measurement is invalid.

Clause 9.2.4.7.1

For the Sustainability Test Phase the FDR shall contain:

- 1. A Data Rate Distribution graph and data table.
- 2. I/O Request Throughput Distribution graph and data table.
- 3. A Response Time Frequency Distribution graph and table.
- 4. An Average Response Time Distribution graph and table.
- 5. The human readable Test Run Results File produced by the Workload Generator (may be included in an appendix).
- 6. A listing or screen image of all input parameters supplied to the Workload Generator (may be included in an appendix).
- 7. The Measured Intensity Multiplier for each I/O stream.
- 8. The variability of the Measured Intensity Multiplier, as defined in Clause 5.3.13.3.

SPC-1 Workload Generator Input Parameters

The SPC-1 Workload Generator input parameters for the Sustainability, IOPS, Response Time Ramp, Repeatability, and Persistence Test Runs are documented in "Appendix E: SPC-1 Workload Generator Input Parameters" on Page 67.

Sustainability - Response Time Frequency Distribution Graph

Sustainability - Measured Intensity Multiplier and Coefficient of Variation

Clause 3.4.3

IM – Intensity Multiplier: The ratio of I/Os for each I/O stream relative to the total I/Os for all I/O streams (ASU1-1 – ASU3-1) as required by the benchmark specification.

Clauses 5.1.0 and 5.3.13.2

MIM – Measured Intensity Multiplier: The Measured Intensity Multiplier represents the ratio of measured I/Os for each I/O stream relative to the total I/Os measured for all I/O streams (ASU1-1 – ASU3-1). This value may differ from the corresponding Expected Intensity Multiplier by no more than 5%.

Clause 5.3.13.3

COV - Coefficient of Variation: This measure of variation for the Measured Intensity Multiplier cannot exceed 0.2.

	ASU1-1	ASU1-2	ASU1-3	ASU1-4	ASU2-1	ASU2-2	ASU2-3	ASU3-1
IM	0.0350	0.2810	0.0700	0.2100	0.0180	0.0700	0.0350	0.2810
MIM	0.350	0.2818	0.0700	0.2100	0.0180	0.0700	0.0350	0.2810
COV	0.004	0.001	0.003	0.001	0.005	0.003	0.004	0.001

Primary Metrics Test - IOPS Test Phase

Clause 5.4.2.2

The IOPS Test Phase consists of one Test Run at the 100% load point with a Measurement Interval of ten (10) minutes. The IOPS Test Phase immediately follows the Sustainability Test Phase without any interruption or manual intervention.

The IOPS Test Run generates the SPC-1 IOPSTM primary metric, which is computed as the I/O Request Throughput for the Measurement Interval of the IOPS Test Run.

The Average Response Time is computed for the IOPS Test Run and cannot exceed 30 milliseconds. If the Average Response Time exceeds the 30 millisecond constraint, the measurement is invalid.

Clause 9.2.4.7.2

For the IOPS Test Phase the FDR shall contain:

- 1. I/O Request Throughput Distribution (data and graph).
- 2. A Response Time Frequency Distribution.
- 3. An Average Response Time Distribution.
- 4. The human readable Test Run Results File produced by the Workload Generator.
- 5. A listing or screen image of all input parameters supplied t the Workload Generator.
- 6. The total number of I/O Requests completed in the Measurement Interval as well as the number of I/O Requests with a Response Time less than or equal to 30 milliseconds and the number of I/O Requests with a Response Time greater than 30 milliseconds.

SPC-1 Workload Generator Input Parameters

The SPC-1 Workload Generator input parameters for the Sustainability, IOPS, Response Time Ramp, Repeatability, and Persistence Test Runs are documented in "Appendix E: SPC-1 Workload Generator Input Parameters" on Page 67.

IOPS Test Run - Measured Intensity Multiplier and Coefficient of Variation

Clause 3.4.3

IM – Intensity Multiplier: The ratio of I/Os for each I/O stream relative to the total I/Os for all I/O streams (ASU1-1 – ASU3-1) as required by the benchmark specification.

Clauses 5.1.0 and 5.3.13.2

MIM – Measured Intensity Multiplier: The Measured Intensity Multiplier represents the ratio of measured I/Os for each I/O stream relative to the total I/Os measured for all I/O streams (ASU1-1 – ASU3-1). This value may differ from the corresponding Expected Intensity Multiplier by no more than 5%.

Clause 5.3.13.3

COV - Coefficient of Variation: This measure of variation for the Measured Intensity Multiplier cannot exceed 0.2.

Primary Metrics Test - Response Time Ramp Test Phase

Clause 5.4.2.3

The Response Time Ramp Test Phase consists of five Test Runs, one each at 95%, 90%, 80%, 50%, and 10% of the load point (100%) used to generate the SPC-1 IOPSTM primary metric. Each of the five Test Runs has a Measurement Interval of ten (10) minutes. The Response Time Ramp Test Phase immediately follows the IOPS Test Phase without any interruption or manual intervention.

The five Response Time Ramp Test Runs, in conjunction with the IOPS Test Run (100%), demonstrate the relationship between Average Response Time and I/O Request Throughput for the Tested Storage Configuration (TSC) as illustrated in the response time/throughput curve on page 12.

In addition, the Average Response Time measured during the 10% Test Run is the value for the SPC-1 LRT^{TM} metric. That value represents the Average Response Time of a lightly loaded TSC.

Clause 9.2.4.7.3

The following content shall appear in the FDR for the Response Time Ramp Phase:

- 1. A Response Time Ramp Distribution.
- 2. The human readable Test Run Results File produced by the Workload Generator for each Test Run within the Response Time Ramp Test Phase.
- 3. For the 10% Load Level Test Run (SPC-1 LRTTM metric) an Average Response Time Distribution.
- 4. A listing or screen image of all input parameters supplied to the Workload Generator.

SPC-1 Workload Generator Input Parameters

The SPC-1 Workload Generator input parameters for the Sustainability, IOPS, Response Time Ramp, Repeatability, and Persistence Test Runs are documented in "Appendix E: SPC-1 Workload Generator Input Parameters" on Page 67.

Response Time Ramp Test Results File

A link to each test result file generated from each Response Time Ramp Test Run list listed below.

Response Time Ramp Distribution (IOPS) Data

The five Test Runs that comprise the Response Time Ramp Phase are executed at 95%, 90%, 80%, 50%, and 10% of the Business Scaling Unit (BSU) load level used to produce the SPC-1 IOPS™ primary metric. The 100% BSU load level is included in the following Response Time Ramp data tables and graphs for completeness.

Start-Up/Ramp-Up	100% Load Level - 620 BSUs	Start	Stop	Interval		95% Load Level - 589 BSUs	Start	Stop	Interval	Duration

SPC-1 LRT™ Average Response Time (ms) Distribution Graph

SPC-1 LRT™ (10%) - Measured Intensity Multiplier and Coefficient of Variation

Clause 3.4.3

IM – Intensity Multiplier: The ratio of I/Os for each I/O stream relative to the total I/Os for all I/O streams (ASU1-1 – ASU3-1) as required by the benchmark specification.

Clauses 5.1.0 and 5.3.13.2

MIM – Measured Intensity Multiplier: The Measured Intensity Multiplier represents the ratio of measured I/Os for each I/O stream relative to the total I/Os measured for all I/O streams (ASU1-1 – ASU3-1). This value may differ from the corresponding Expected Intensity Multiplier by no more than 5%.

Clause 5.3.13.3

COV - Coefficient of Variation: This measure of variation for the Measured Intensity Multiplier cannot exceed 0.2.

Submitted for Review: MARCH 18, 2008

Repeatability Test

Clause 5.4.5

The Repeatability Test demonstrates the repeatability and reproducibility of the SPC-1 IOPSTM primary metric and SPC-1 LRTTM metric generated in earlier Test Runs.

There are two identical Repeatability Test Phases. Each Test Phase contains two Test Runs. Each of the Test Runs will have a Measurement Interval of no less than ten (10) minutes. The two Test Runs in each Test Phase will be executed without interruption or any type of manual intervention.

The first Test Run in each Test Phase is executed at the 10% load point. The Average Response Time from each of the Test Runs is compared to the SPC-1 LRTTM metric. Each Average Response Time value must be less than the SPC-1 LRTTM metric plus 5%.

The second Test Run in each Test Phase is executed at the 100% load point. The I/O Request Throughput from the Test Runs is compared to the SPC-1 IOPSTM primary metric. Each I/O Request Throughput value must be greater than the SPC-1 IOPSTM primary metric minus 5%. In addition, the Average Response Time for each Test Run cannot exceed 30 milliseconds.

If any of the above constraints are not met, the benchmark measurement is invalid.

Clause 9.2.4.7.4

The following content shall appear in the FDR for each Test Run in the two Repeatability Test Phases:

- 1. A table containing the results of the Repeatability Test.
- 2. An I/O Request Throughput Distribution graph and table.
- 3. An Average Response Time Distribution graph and table.
- 4. The human readable Test Run Results File produced by the Workload Generator.
- 5. A listing or screen image of all input parameters supplied to the Workload Generator.

SPC-1 Workload Generator Input Parameters

The SPC-1 Workload Generator input parameters for the Sustainability, IOPS, Response Time Ramp, Repeatability, and Persistence Test Runs are documented in "Appendix E: SPC-1 Workload Generator Input Parameters" on Page 67.

Submitted for Review: MARCH 18, 2008

Repeatability Test Results File

The values for the SPC-1 IOPS $^{\text{\tiny TM}}$, SPC-1 LRT $^{\text{\tiny TM}}$, and the Repeatability Test measurements are listed below.

	SPC-1 IOPS™	SPC-1 LRT™
Primary Metrics	30,992.39	2.86
Repeatability Test Phase 1	30,994.86	2.88
Repeatability Test Phase 2	30,992.36	2.86

A link to the test result file generated from each Repeatability Test Run list is listed below.

Repeatability Test Phase 1, Test Run 1 (LRT)

Repeatability Test Phase 1, Test Run 2 (IOPS)

Repeatability Test Phase 2, Test Run 1 (LRT)

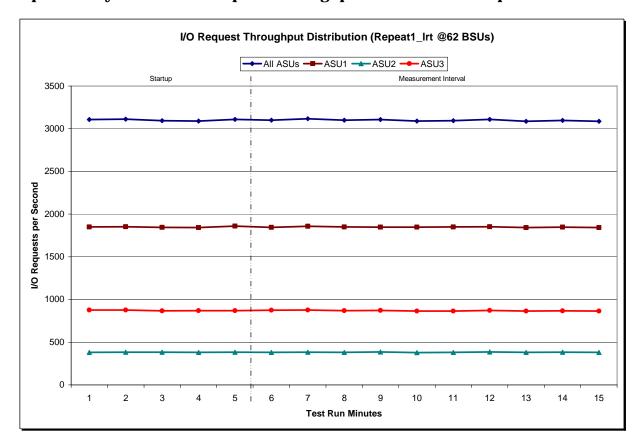

Repeatability Test Phase 2, Test Run 2 (IOPS)

Repeatability 1 (LRT) Measured Intensity Multiplier and Coefficient of Variation

Clause 3.4.3

IM – Intensity Multiplier: The ratio of I/Os for each I/O stream relative to the total I/Os for all I/O streams (ASU1-1 – ASU3-1) as required by the benchmark specification.

Clauses 5.1.0 and 5.3.13.2

MIM – Measured Intensity Multiplier: The Measured Intensity Multiplier represents the ratio of measured I/Os for each I/O stream relative to the total I/Os measured for all I/O streams (ASU1-1 – ASU3-1). This value may differ from the corresponding Expected Intensity Multiplier by no more than 5%.

Clause 5.3.13.3

COV - Coefficient of Variation: This measure of variation for the Measured Intensity Multiplier cannot exceed 0.2.

Data Persistence Test

Clause 6

The Data Persistence Test demonstrates the Tested Storage Configuration (TSC):

- Is capable of maintain data integrity across a power cycle.
- Ensures the transfer of data between Logical Volumes and host systems occurs without corruption or loss.

The SPC-1 Workload Generator will write 16 block I/O requests at random over the total Addressable Storage Capacity of the TSC for ten (10) minutes at a minimum of 25% of the load used to generate the SPC-1 IOP^{TM} primary metric. The bit pattern selected to be written to each block as well as the address of the block will be retained in a log file.

The Benchmark Configuration will be shutdown and restarted using a power off/power on cycle at the end of the above sequence of write operations. In addition, any caches employing battery backup must be flushed/emptied.

The SPC-1 Workload Generator will then use the above log file to verify each block written contains the correct bit pattern.

Clause 9.2.4.8

The following content shall appear in this section of the FDR:

- 1. A listing or screen image of all input parameters supplied to the Workload Generator.
- 2. For the successful Data Persistence Test Run, a table illustrating key results. The content, appearance, and format of this table are specified in Table 9-12. Information displayed in this table shall be obtained from the Test Run Results File referenced below in #3.
- 3. For the successful Data Persistence Test Run, the human readable Test Run Results File produced by the Workload Generator.

SPC-1 Workload Generator Input Parameters

The SPC-1 Workload Generator input parameters for the Sustainability, IOPS, Response Time Ramp, Repeatability, and Persistence Test Runs are documented in "Appendix E: SPC-1 Workload Generator Input Parameters" on Page 67.

Data Persistence Test Results File

A link to each test result file generated from each Data Persistence Test is listed below.

Persistence 1 Test Results File
Persistence 2 Test Results File

Data Persistence Test Results

Data Persistence Test Results						
Data Persistence Test Run Number: 1						
Total Number of Logical Blocks Written	74,307,024					
Total Number of Logical Blocks Verified	39,139,120					
Total Number of Logical Blocks that Failed Verification	0					
Time Duration for Writing Test Logical Blocks	10 minutes					
Size in Bytes of each Logical Block	512					
Number of Failed I/O Requests in the process of the Test	0					

In some cases the same address was the target of multiple writes, which resulted in more Logical Blocks Written than Logical Blocks Verified. In the case of multiple writes to the same address, the pattern written and verified must be associated with the last write to that address.

PRICED STORAGE CONFIGURATION AVAILABILITY DATE

Clause 9.2.4.9

The committed delivery data for general availability (Availability Date) of all products that comprise the Priced Storage Configuration must be reported. When the Priced Storage Configuration includes products or components with different availability dates, the reported Availability Date must be the date at which all components are committed to be available.

The FDR shall state: "The Priced Storage Configuration, as documented in this Full Disclosure Report will be available for shipment to customers on MMMM DD, YYYY." Where Priced Storage Configuration is the TSC Configuration Name as described in Clause 9.2.4.3.3 and MMMM is the alphanumeric month, DD is the numeric day, and YYYY is the numeric year of the date that the Priced Storage Configuration, as documented, is available for shipment to customers as described above.

The NetApp FAS3040 (48-hour Sustainability Test) as documented in this Full Disclosure Report will become available for customer purchase and shipment on March 18, 2008.

PRICING INFORMATION

Clause 9.2.4.11

A statement of the respective calculations for pricing must be included.

Clause 9.2.4.11.3

A list of all differences between the Tested Storage Configuration (TSC) and Priced Storage Configuration must be included.

Pricing information may found in the Tested Storage Configuration Pricing section on page 13. A list of all differences between the Tested Storage Configuration (TSC) and Priced Storage Configuration may be found in the Executive Summary portion of this document on page 13.

Anomalies or Irregularities

Clause 9.2.4.10

The FDR shall include a clear and complete description of any anomalies or irregularities encountered in the course of executing the SPC-1 benchmark that may in any way call into question the accuracy, verifiability, or authenticity of information published in this FDR.

There were no anomalies or irregularities encountered during the SPC-1 Remote Audit of the NetApp FAS3040 (48-hour Sustainability Test).

APPENDIX A: SPC-1 GLOSSARY

"Decimal" (powers of ten) Measurement Units

In the storage industry, the terms "kilo", "mega", "giga", "tera", "peta", and "exa" are commonly used prefixes for computing performance and capacity. For the purposes of the SPC workload definitions, all of the following terms are defined in "powers of ten" measurement units.

- A kilobyte (KB) is equal to 1,000 (103) bytes.
- A megabyte (MB) is equal to 1,000,000 (106) bytes.
- A gigabyte (GB) is equal to 1,000,000,000 (109) bytes.
- A terabyte (TB) is equal to 1,000,000,000,000 (1012) bytes.
- A petabyte (PB) is equal to 1,000,000,000,000,000 (1015) bytes
- An exabyte (EB) is equal to 1,000,000,000,000,000,000 (1018) bytes

"Binary" (powers of two) Measurement Units

The sizes reported by many operating system components use "powers of two" measurement units rather than "power of ten" units. The following standardized definitions and terms are also valid and may be used in this document.

- A kibibyte (KiB) is equal to 1,024 (210) bytes.
- A mebibyte (MiB) is equal to 1,048,576 (2²⁰) bytes.
- A gigibyte (GiB) is equal to 1,073,741,824 (2³⁰) bytes.
- A tebibyte (TiB) is equal to 1,099,511,627,776 (240) bytes.
- A pebibyte (PiB) is equal to 1,125,899,906,842,624 (2⁵⁰) bytes.
- An exbibyte (EiB) is equal to 1,152,921,504,606,846,967 (260) bytes.

SPC-1 Data Repository Definitions

Total ASU Capacity: The total storage capacity read and written in the course of executing the SPC-1 benchmark.

Application Storage Unit (ASU): The logical interface between the storage and SPC-1 Workload Generator. The three ASUs (Data, User, and Log) are typically implemented on one or more Logical Volume.

Logical Volume: The division of Addressable Storage Capacity into individually addressable logical units of storage used in the SPC-1 benchmark. Each Logical Volume is implemented as a single, contiguous address space.

Addressable Storage Capacity: The total storage (sum of Logical Volumes) that can be read and written by application programs such as the SPC-1 Workload Generator.

Configured Storage Capacity: This capacity includes the Addressable Storage Capacity and any other storage (parity disks, hot spares, etc.) necessary to implement the Addressable Storage Capacity.

Physical Storage Capacity: The formatted capacity of all storage devices physically present in the Tested Storage Configuration (TSC).

Data Protection Overhead: The storage capacity required to implement the selected level of data protection.

Required Storage: The amount of Configured Storage Capacity required to implement the Addressable Storage Configuration, excluding the storage required for the three ASUs.

Global Storage Overhead: The amount of Physical Storage Capacity that is required for storage subsystem use and unavailable for use by application programs.

Total Unused Storage: The amount of storage capacity available for use by application programs but not included in the Total ASU Capacity.

SPC-1 Data Protection Levels

RAID5: User data is distributed across the disks in the array. Check data corresponding to user data is distributed across multiple disks in the form of bit-by-bit parity.

Mirroring: Two or more identical copies of user data are maintained on separate disks.

Other Protection Level: Any data protection other than RAID5 or Mirroring.

Unprotected: There is no data protection provided.

SPC-1 Test Execution Definitions

Average Response Time: The sum of the Response Times for all Measured I/O Requests divided by the total number of Measured I/O Requests.

Completed I/O Request: An I/O Request with a Start Time and a Completion Time (see "I/O Completion Types" below).

Completion Time: The time recorded by the Workload Generator when an I/O Request is satisfied by the TSC as signaled by System Software.

Data Rate: The data transferred in all Measured I/O Requests in an SPC-1 Test Run divided by the length of the Test Run in seconds.

Expected I/O Count: For any given I/O Stream and Test Phase, the product of 50 times the BSU level, the duration of the Test Phase in seconds, and the Intensity Multiplier for that I/O Stream.

Failed I/O Request: Any I/O Request issued by the Workload Generator that could not be completed or was signaled as failed by System Software. A Failed I/O Request has no Completion Time (see "I/O Completion Types" below).

I/O Request Throughput: The total number of Measured I/O requests in an SPC-1 Test Run divided by the duration of the Measurement Interval in seconds.

In-Flight I/O Request: An I/O Request issued by the I/O Command Generator to the TSC that has a recorded Start Time, but does not complete within the Measurement Interval (see "I/O Completion Types" below).

Measured I/O Request: A Completed I/O Request with a Completion Time occurring within the Measurement Interval (see "I/O Completion Types" below).

Measured Intensity Multiplier: The percentage of all Measured I/O Requests that were issued by a given I/O Stream.

Measurement Interval: The finite and contiguous time period, after the TSC has reached Steady State, when data is collected by a Test Sponsor to generate an SPC-1 test result or support an SPC-1 test result.

Ramp-Up: The time required for the Benchmark Configuration (BC) to produce Steady State throughput after the Workload Generator begins submitting I/O Requests to the TSC for execution.

Ramp-Down: The time required for the BC to complete all I/O Requests issued by the Workload Generator. The Ramp-Down period begins when the Workload Generator ceases to issue new I/O Requests to the TSC.

Response Time: The Response Time of a Measured I/O Request is its Completion Time minus its Start Time.

Start Time: The time recorded by the Workload Generator when an I/O Request is submitted, by the Workload Generator, to the System Software for execution on the Tested Storage Configuration (TSC).

Start-Up: The period that begins after the Workload Generator starts to submit I/O requests to the TSC and ends at the beginning of the Measurement Interval.

Shut-Down: The period between the end of the Measurement Interval and the time when all I/O Requests issued by the Workload Generator have completed or failed.

Steady State: The consistent and sustainable throughput of the TSC. During this period the load presented to the TSC by the Workload Generator is constant.

Test: A collection of Test Phases and or Test Runs sharing a common objective.

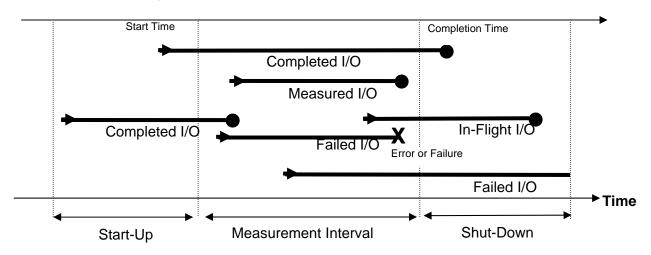

Test Run: The execution of SPC-1 for the purpose of producing or supporting an SPC-1 test result. SPC-1 Test Runs may have a finite and measured Ramp-Up period, Start-Up

Submitted for Review: MARCH 18, 2008

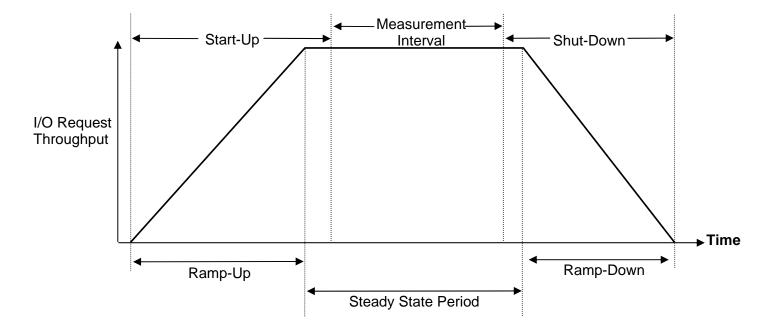

period, Shut-Down period, and Ramp-Down period as illustrated in the "SPC-1 Test Run Components" below. All SPC-1 Test Runs shall have a Steady State period and a Measurement Interval.

Test Phase: A collection of one or more SPC-1 Test Runs sharing a common objective and intended to be run in a specific sequence.

I/O Completion Types

SPC-1 Test Run Components

APPENDIX B: CUSTOMER TUNABLE PARAMETERS AND OPTIONS

Windows 2003 Server

For each HBA in the system, change the execution throttle (queue depth) from the default value of 16 to 256.

FAS3040 Storage Controllers

The following changes must be made on each controller:

- LUN options: Create the LUNs without space reservations. By default, the "lun create" command creates LUNs with space reservations. Instead of reserving space for the LUNs, the LUN create script pre-allocates space for all of the LUNs by overwriting every block of each LUN (see Appendix C), as required by the SPC-1 specification.
- Volume Options (applied to vol0, the ONTAP root volume):
 - o Resize the volume from its default size of 100 GB to 30 GB.
 - o Change the volume option "nosnap" from its default value of "off" to "on". This disables the automatic creation of Snapshot copies.
- Volume Options (applied to vol1, the SPC data set volume):
 - Create the volumes with a space reservation requirement of "none" rather than
 the default value of "volume". Because all of the LUNs in the volume are preallocated there is no need to reserve space in the volume.
 - o Change the volume option "nosnap" from its default value of "off" to "on". This disables the automatic creation of Snapshot™ copies.
- Aggregate Options (applied to aggr0, the only aggregate in the system)
 - Change the aggregate Snapshot reserve to 0 bytes.
 - o Change the aggregate option "nosnap" from its default value of "off" to "on".

These changes disable automatic Snapshot copies at the aggregate level.

- System Flags:
 - wafl_optimize_write_once: change default value of 1 to 0. This flag affects the initial layout of data within a newly created aggregate. The default data layout favors applications which do not overwrite their data.
 - wafl_downgrade_target: change default value of 1 to 0. This flag changes the runtime priority of the process that handles the SCSI protocol for incoming Fibre-Channel requests. For storage systems that are not also servicing NAS requests this change to the process priority is recommended.

APPENDIX C: TESTED STORAGE CONFIGURATION (TSC) CREATION

Host System

- Install Microsoft Windows Server 2003 Service Pack 2.
- Install and setup two Qlogic 2462 HBAs using NetApp certified Qlogic driver.
- Install NetApp's FCP Windows® Host Utilities 3.0 for Native OS
- Install Qlogic SANsurfer HBA management software.
- Install Data ONTAP DSM 3.2 for Windows MPIO and set it up to use round robin load balancing policy.
- Set the "Execution Throttle" (also known as HBA queue depth) setting on each FCP port from default of 16 to 256 using SANsurfer HBA management software.

Brocade FCP Switches

Connect the physical connections from the Host System to the FAS3040 as illustrated on page 14 (Benchmark Configuration/Tested Storage Configuration Diagram).

Storage Controllers

The following sections document how to set up the storage controllers and create the raid-groups, aggregates, volumes and LUNs that comprise the SPC-1 data repository.

Initializing Disk Ownership

The NetApp FAS3040 system consists of two storage controllers. Before the systems are installed the ownership of the individual disks must be established in the following fashion:

- Each controller should be setup with 3 active and 3 passive FCAL connections to the disk shelves
- Each controller should be setup with 5 active shelves (total 10 disk shelves between the two controllers). Each controller should own all disks in its 5 active shelves.

After the FCAL connections to disk shelves and disk ownership has been established, zero (initialize) all disks by executing the following steps on each NetApp controller:

- 1. Boot the NetApp controllers either by power cycling or typing "boot" at the "LOADER>" prompt on the console screen
- 2. Hit "CTRL C" during the boot process when prompted for the special boot menu on the console screen
- 3. Once at special boot menu, select option "4a" to zero (initialize) all disks and install a flexible root volume
- 4. After zeroing (initialization) of all disks are completed, follow the remaining prompts to complete the basic setup of NetApp controller.

APPENDIX C: Page 58 of 69

After zeroing (initialization) of all disks and basic setup is completed, install NetApp Data ONTAP 7.3 by executing the following steps:

- 1. Download Data ONTAP 7.3 system files for FAS3040 platform from NetApp's NOW site to a directory location that can be accessed via an http URL.
- 3. Once the installation of system files is completed, type "download" at the command prompt of NetApp controllers
- 4. Once "download" command completes, reboot the NetApp controller for changes to take effect.

Installing Licenses

The following licenses must be installed after NetApp ONTAP 7.3 system software installation has completed:

- cluster
- fcp

To install the licenses, execute the following command at NetApp controller's command prompt:

license add <license key>

Base Setup Script - FAS3040 Controllers

Once licenses are installed and both FAS3040 controllers rebooted, the perl script below should be run from the Host System to setup both FAS3040 controllers with appropriate storage sizes for SPC-1 ASUs. The script is invoked using the following syntax:

ntap_spc1_cfg.pl -f controller_a,controller_b -i wwpn_1,wwpn_2,wwpn_3,wwpn_4 -t timehost_ip_addr

The script does the following on each FAS3040 controller:

- modify /etc/rc file with the following setflags so these are persistent across reboots:
 - o setflag wafl_optimize_write_once 0
 - setflag wafl_downgrade_target 0
- set timezone to EST5EDT
- sets the following setflags to appropriate settings:
 - o wafl optimize write once 0
 - wafl_downgrade_target 0
- create aggregate with the following configuration:
 - o aggr0 settings, 4 rgs, rg sizes (1x18 + 3x17), 1 spare
 - o aggr0 options:
 - nosnap=on
 - set snap reserve = 0 on aggregate aggr0
 - set snap sched to 0 0 0 on the aggregate aggr0

SPC BENCHMARK 1TM V1.10.1

FULL DISCLOSURE REPORT

- Configure the flexible volumes within aggregate with the following configuration:
 - Root flexible volume (vol0)
 - resize root volume to 30GB
 - set volume options on root volume vol0
 - nosnap=on
 - nosnapdir=off
 - set snap reserve = 0 on vol0
 - set snap sched to 0 0 0 on vol0
 - o spc1 data flexible volume (vol1):
 - create vol1 of size 8493820 MB
 - set volume options on vol1:
 - o nosnap=on
 - o nosnapdir=off
 - set snap reserve = 0 on vol1
 - set snap sched to 0 0 0 on vol1
 - set space reservation (guarantee) to "none"
- Create fcp portset to contain NetApp controller ports 0a and 0c. Then, create windows igroup
 which contains the wwpn of FCP HBAs initiators in the SPC-1 Windows driver system
- Create zeroed luns with no space reservation on each NetApp controller with the following sizes
 and then map them to the windows igroup created earlier assigning each lun a unique lun id.
 - o 6 lun files for ASU1 of size 450100 MB each
 - o 6 lun files for ASU2 of size 450100 MB each
 - o 6 lun files for ASU3 of size 100022 MB each
- Verify fcp is started on both NetApp controllers.

Host Disk Stripe Setup

Once the ASU LUNs are visible on the Windows host, execute the following steps to stripe the appropriate ASU LUNs together and assign a drive letter:

- In Windows disk management MMC, initialize each disk associated with the ASU luns.
- Convert each of the same disks to dynamic disks
- Create three striped volumes for ASU1, ASU2, and ASU3.
 - o Stripe each volume across all 12 luns associated with each respective ASU.
 - o Assign drive letter "E" for ASU1
 - o Assign drive letter "F" for ASU2
 - Assign drive letter "G" for ASU3
